GENERAL INFORMATION:
APPLICANT: WalkerPeach, Cindy
APPLICANT: DuBois, Dwight
TITLE OF INVENTION: Compositions, methods and Kits for Herpes Simplex Virus Type 1
TITLE OF INVENTION: Nucleic Acid Detection
FILE REFERENCE: 25436/1280
CURRENT APPLICATION NUMBER: US/09/594,065
CURRENT APPLICATION NUMBER: US/09/594,065
CURRENT FILING DATE: 2000-06-14
NUMBER OF SEQ ID NOS: 14
SOFTWARE: Patentin version 3.0
SEQ ID NO 4
LENGTH: 33
TYPE: DNA
TYPE: DNA

Sequence 16591, Application US/60495114

GENERAL INFORMATION:
APPLICANT: CARGILL, Michele
TITLB OF INVENTION: POLYMORPHISMS IN NUCLEIC ACID MOLECULES
TITLB OF INVENTION: ENCODING HUMAN PROTEASE PROTEINS, METHODS OF DETECTION AND
TITLB OF INVENTION: USES THEREOF
FILE REFERENCE: CL001480
CURRENT PPLICATION NUMBER: US/60/495,114
CURRENT FILING DATE: 2003-08-15
NUMBER OF SEQ ID NOS: 91238
SOFTWARE: FASTSEQ for Windows Version 4.0
SEQ ID NO 16591
LENGTH: 62312
TYPE: DNA
ORGANISM: Homo sapiens
FEATURE:
NAME/KEY: misc_feature
LOCATION: (1)...(62312)
OTHER INFORMATION: n = A,T,C or G, or insertion/deletion polymorphism (see Tables 1-

Pred. No.

is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Original source text: HSV1 strain tsB5 DNA, clone pTBG-BS1.
HSV1 strain tsB5 is a mutant of strain HFEM that is temperature dependent for virus growth, production of gB, and fusion of Vero and HBL cells. The syn and ts lesions of tsB5 are separable by recombination, the syn defect being located between 0.345 and 0.355 map units, and the ts defect being located between 0.360 and 0.368 map units. The rate of entry determinant of tsB5 is genetically separable from both the syn and ts lesions and is located between 0.350 and 0.360 map units, which is entirely within the glycoprotein B gene (0.348 to 0.366 map units).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                _

POLYPEPTIDE AND ITS PRODUCTION
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Stain ts85 has a total of 12 base substitutions within the coding region for 9B when compared to strain KOS. Of these, only two cause amino acid substitutions, a 't' to 'c' transition at bp 695 causes a Val to Ala substitution, and a 'g' to 'a' transition at bp 1610 causes an Arg to His substitution. Because the rate-of-entry determinant has been mapped to between 0.350 and 0.360 mag units, the transition at bp 695 must be responsible for the difference in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          B03093.1 GI:2171311 JP 1991218397-A/2.

The recombinant protein can be used to prepare vaccines for prophylaxis of HSV infection and for use in diagnostic kits. See also AAQ14478.
                                                                                                                                                                                                   Chan
           This sequence represents a Herpes simplex virus type-2 (HSV-2) DN sequence of the invention. This sequence was isolated from HSV-2 SB5 (deposited as ATCC VR-2546), is designated Contig ID 14, and a HSV-2 protein. The protein can be used for the treatment or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sequence of the invention. This sequence was isolated from HSV-2 strain SB5 (deposited as ATCC VR-2546), is designated Contig ID 91, and encodes a HSV-2 protein. The proteins can be used for the treatment or prevention of disease, to induce an immunological response in a mammal or to identify inhibitors, activators or novel antivirals. Antagonists of the proteins can be used to inhibit a viral polypeptide. The DNA sequence or a vector containing it can also be used to induce an immunological

glycoprotein. Such sequences have been used to develop synthetic DNA primers which have homologous sequences of conserved regions which flank a divergent region of the gB glycoprotein gene. In addition, proteins such as the gB glycoprotein have potential use in the development of serological immunoassays. One approach is to synthesize peptides which, based on the properties of the predicted protein sequence, are likely to be immunologically active. Such peptides can be used as substrate antigens in immunoassays to detect serum antibodies which recognize this specific peptide sequence. Synthetic peptides may also be used to produce antibodies against specific regions of the gB glycoprotein which are unique to one virus. These can then be used to develop virus specific primate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The DNA sequence encodes a fusion protein comprising herpes simplex virus (HSV) surface antigens gB and gD. This fusion protein shows the same physiological activity as surface antigen prepd. from HSV infected cells. It can be used in a vaccine for the prevention of

                                                                                                                                                                                                            The gene encodes a gB glycoprotein which is useful for the production of vaccines conferring protection against herpes simplex virus infections. The vaccine is Bafe in use and does not contain a carcinogenic gene, as with prior vaccines.

                                                                                                                                                  The gene encoding HSV gB is cloned into B.coli. To increase the efficiency of expression, the gene encoding the C-terminal region of gB, which is very hydrophobic, is removed and the remaining gene is cloned into an expression vector. The vector is composed of pBR322, SV40 early promoter and the HSV gB gene.

The construct is useful for the production of a good antigen for
                                                                                                                                                                                                                                                               Recombinant DNA contg. herpes simplex virus gene - is integrated in E.coli plasmid vector, contg. incorporated promoter region for animal cells, giving antigen.
